

Improving Livelihoods for Informal Workers

July 2026

SECTION -1

Work that brings a **fair income, safety and security** at the workplace, some protection for families when things go wrong, and a chance to learn, grow, and be treated with dignity

***Paid work** underpins dignity, stability, and human potential*

The worker's reality today

Unpaid

Waits weeks to receive payment
No way to know when or how much

Stuck

No work history, poor opportunity
They are literally off the grid

Unprotected

Unable to build a safety net
No access to credit or a recourse if unpaid

Formal worker

time →

A trusted work record

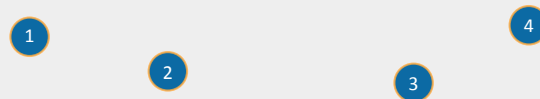

Portability of work record

Continuity

Informal worker

time →

A trusted work record

Portability of work record

Continuity

To address these challenges for an informal worker a new approach is needed

DPI for Livelihoods

GPS

"I am here."

Aadhaar

"I am who I say I am."

DPI for Livelihoods

"I have done what I claim I have done."

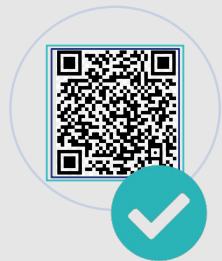

ATOMIC UNIT OF THIS INFRASTRUCTURE

A work event - A verifiable record of a discrete piece of work

- Owned by the worker
- Attested by an issuer
- Presentable to any verifier

Accumulates into a work history over time

This one credential creates many opportunities

RELIABLE PAYMENTS

EMPLOYMENT MATCHING

UPSKILLING

SOCIAL PROTECTION

Five-layer architecture

Layer	Responsibility
Layer 5 — Experience Layer	Worker: WhatsApp bot, lightweight app, USSD. Employer: web portal, API, WhatsApp. Verifier: API-first, embeddable widget. Specifier: definition authoring and ratification interface
Layer 4 — Verification Layer	Verification API for employers, lenders, and platforms. Trust score engine — computed at query time, never stored. Consent layer — worker grants access per verification.
Layer 3 — Wallet Layer	Worker-owned credential store Selective disclosure engine Offline-verifiable signed QR
Layer 2 — Attestation Layer	Evidence intake adapters translating source system output into canonical evidence records and validating them against work definitions. Issuance API. Dispute and correction protocol. Implicit attestation engine (payment receipts, platform data)
Layer 1 — Registry Layer	- Employer registry (who is a legitimate issuer, with trust tiers). - Work definition registry (signed, versioned definitions of work) - Skill taxonomy registry (canonical, open skill codes). - Schema registry (what a work credential looks like — versioned and forkable).
Layer 0 — Identity Anchor	Binds to existing identity infrastructure: national ID, mobile OTP, or MOSIP. This DPI never re-creates identity.

Key Roles

Role	Question They Answer
Specifier	What counts as work for this work type, what evidence is acceptable, at which tiers, and who is authorised to issue against this definition?
Issuer	Did this specific worker perform work that meets the definition, supported by the declared evidence?
Verifier	Does this credential resolve to an authorised issuer, issuing under a definition signed by a legitimate specifier, with evidence consistent with that definition?

The Trust Signal - Three Tiers

Tier	Type	Strength	Primary Risk
Tier 1	Outcome-linked (service delivery system)	Strongest - outcome independently recorded by a third-party system	Identity mapping errors; source data quality
Tier 2	Supervisor-entered	Medium - issuer has authority but also has bias	Supervisor-worker collusion or coercion
Tier 3	Worker-asserted	Weakest -no independent corroboration; essential for inclusion	Inflation of work history

Deployment & Operational Model

Layer	Operated By	Contains
Global layer	Crest - transitioning to multilateral body at scale	Issuer public keys. Credential schemas. Skill taxonomy. Work definition mirror (signed definitions only — no personal data). Cross-border verification API.
National instance	Country MoH or designated body	Worker registry. Consent ledger. Campaign registry. Work definition registry (authoritative, signed by the national specifier). Dispute records. All personal data stays in-country.
Experience layer	Crest - open source, self-hostable	Worker app, supervisor app, verifier portal, specifier ratification interface. Countries may self-host or use Crest-hosted version.

Who takes up what role ?

Issuer	Role in the Chain
National Ministry of Health	Root of trust — sovereign authority over health programmes
Provincial Health Department	Delegates campaign authority to districts
District Health Office	Manages campaign rosters and supervisors
Facility / Clinic	Operational base for CHW deployment
Campaign Coordinator (NGO)	Day-to-day management of workers in the field
Community Health Worker	The worker - asserting their own events

SECTION -2

Trusted payments is the **entry** use case for DPI for Livelihoods

Gets paid reliably

On time, across all programs, in one place

Builds a track record

Work history unlocks credit, skilling & better jobs

Enters formal economy

From invisible worker to recognised economic participant

01

Anchor on the worker

Worker Centricity

Design for the worker in a manner that also works for the program

02

Be program agnostic

Reusability

Every program should be able to adopt it with ease

03

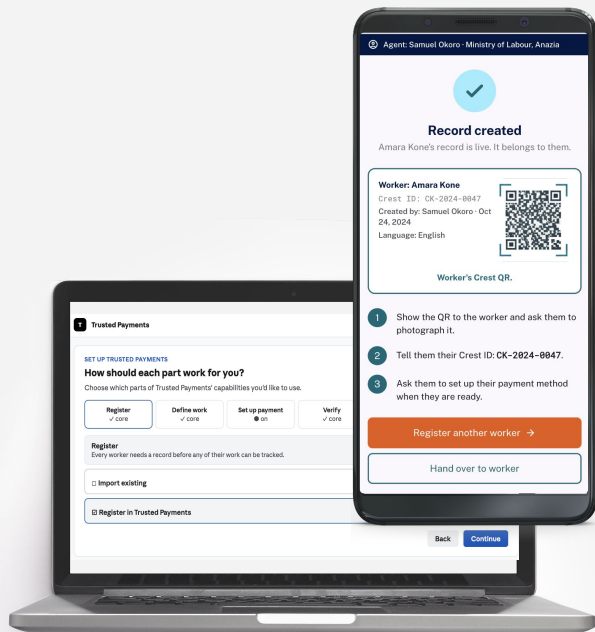

Work with existing systems

Interoperable

This should be able to work with multiple service delivery systems, not replace them

Trusted Infrastructure for Payments for all Public Health Programs

PAYMENTS	NOW	NEXT	LATER
	Health Campaigns	Community Health Work	Public Health
To	Campaign Worker	Community Worker	Any person
From	Program	Multiple programs	Any program
For	Campaign intervention	Any service delivered	Any work recorded
Verified	Attendance, Service Delivered, Location	Attendance + Citizen ID + Supervisor Sign Off	Against proof of work
Via	Digital transfer	Digital transfer	Any mode

Introduction

GOAL: Enable *timely, frictionless* payments and in *full measure* to health and care workers.

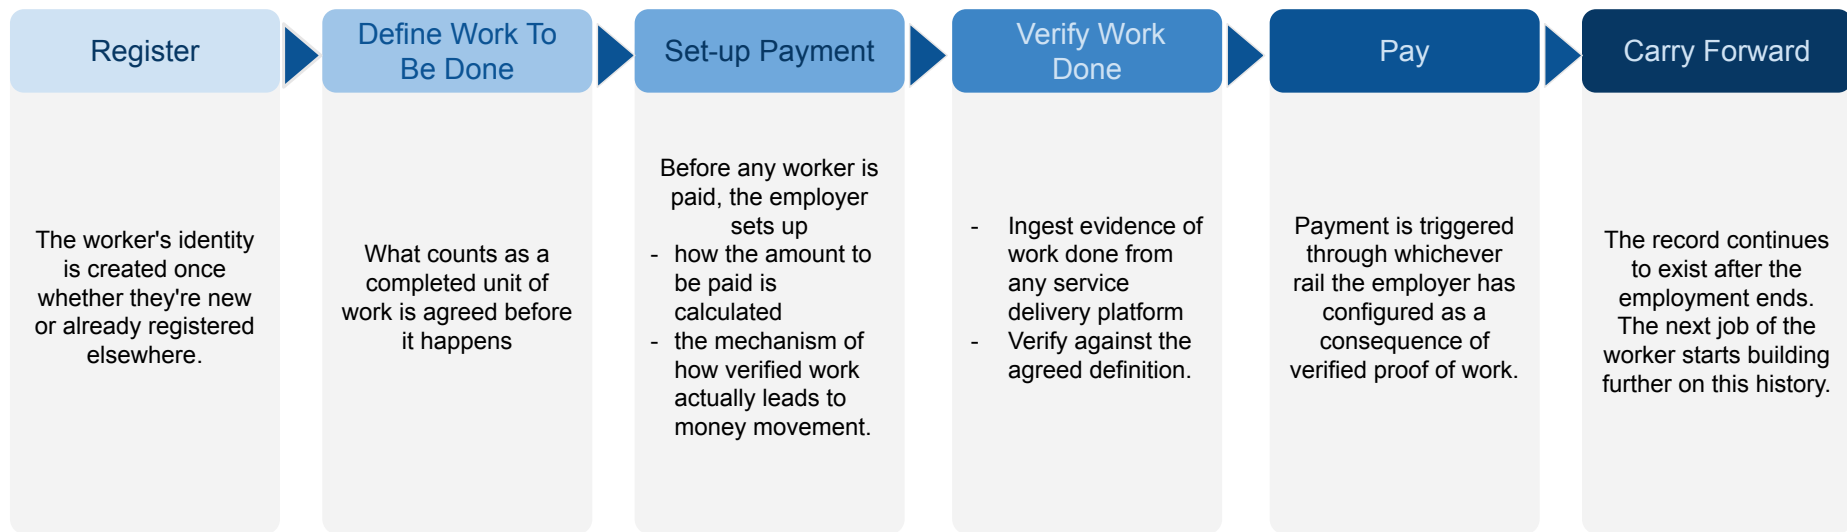

At the end of the work and payment cycle, Trusted Payments offers the worker a portable, verifiable proof of work that travels with them. This proof of work itself becomes the foundation of accountability for governments and funders, rather than treating worker agency and institutional oversight as two separate goals to be balanced against each other.

That portable record isn't locked to this platform. It's built on open, portable identity standards (W3C Verifiable Credentials).

Trusted Payments deliberately keeps the worker at the centre, giving them a reason to keep building their work history. That growing history, in turn, becomes the reason employers come back to reuse the same record - easing recruitment, training and everything that follows from it.

What capabilities does it offer ?

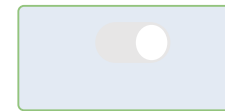

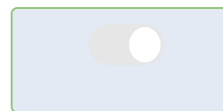

**Trusted
Payments**

Trusted Payments will allow programs to choose the capabilities relevant to them

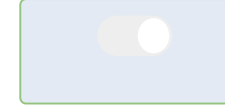

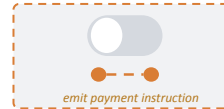

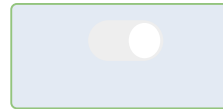

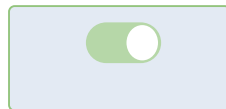

Program 1

Health workers conducting door to door counselling sessions using CommCare to register workers and their work.

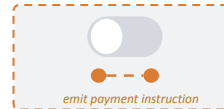

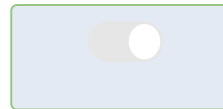

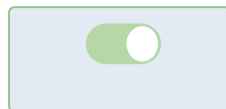

Program 2

Health workers visiting households to deliver polio vaccines, using HCM to register workers, record work and an existing bank integration to make payments

Program 3

A health campaign using ODK to register workers and a local implementer has an existing payment integration with a bank

Trusted
Payments

It will be a horizontal capability working along with existing tools and platforms in use

Program 1

Health workers conducting door to door counselling sessions using CommCare to register workers and their work.

Program 2

Health workers visiting households to deliver polio vaccines, using HCM to register workers, record work and an existing bank integration to make payments

Program 3

A health campaign using ODK to register workers and a local implementer has an existing payment integration with a bank

Value created for each actor

1

For Health Workers

- Timely, frictionless and complete payments
- Verified record of work that travels into the next job, the next program

2

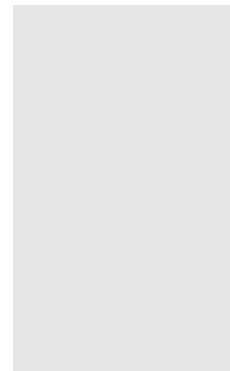

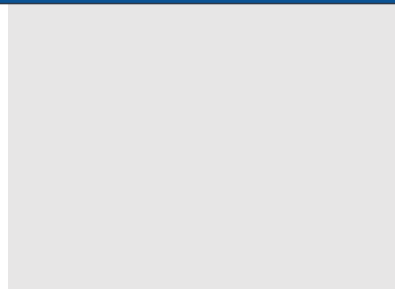

For Program or other Employers

- **Reliable proof of work** verified against the same definition, without depending on a person or a system.
- **Eases onboarding and recruiting** of workers by allowing re-use of existing worker records
- Works with **whatever systems already in use** no need to switch platforms or rebuild anything.

3

For Funders

- An **independently verifiable trail** behind every payment, proof they can check themselves beyond just a report.

Thankyou
